

Intro to React

What is React?

- React is a javascript library for building UI components
- 3 main concepts
 - Declarative
 - Component-Based
 - Learn Once, Write Anywhere
-

Setup and installation

- Just get node: nodejs.org
- And some text editor, recommend vs code

Basic project

- If you want a project immediately to play around with run following commands:
 - `npm install -g create-react-app`
 - `create-react-app my-app`
- This generates a folder called my-app inside will have basic react project made
- Delete js files in their and replace with own
- However wouldn't recommend this method for creating actual projects

Setup with webpack

- Would recommend using webpack
- Uses webpack.config.js file to set config of your system
- Webpack is just an easy way of bundling your js scripts
- If curious about how it works will have links at the end
- Lot of features to it, too many for this tutorial
- My one for a basic setup is on github.com/dyllew3/react-proj
- Then when installed run command: npm install
- Source code in src file, run “npm run start” to start website

JSX elements

```
return <div>Hello React!</div>;
```

- This is a react element called a jsx element, neither html nor javascript but will be rendered to html
- Able to return them from functions and set them as variables or constants

Rendering

- Use ReactDOM to render your jsx element and insert it into the html page

Classes

```
export class Example extends React.Component {  
  render() {  
    return <div>This is an Example</div>;  
  }  
}
```

Can use classes to create react components by extending react.component.

These can have the render function which returns a jsx element and allows the class to be rendered in html. To instantiate it you need `<Example />`

The export keyword just means the function/class/variable can be imported by other files

Properties

- Can pass properties to classes when instantiating them
- Can set them on instantiation
- Builtin in property className which sets css classname of elements

```
export class Example extends React.Component {  
  
  constructor(props) {  
    |   super(props);  
  }  
  
  render() {  
    |   return <div>This is {this.props.name}</div>;  
  }  
}
```

Properties

- Can set when loading by just assigning when using jsx element

- ```
<Example name={"Lizard Man"} />
```

# Conditional Rendering

---

Allows you to conditionally load items

```
function bloop(y){
 if(y){
 <div>true</div>
 }
 else {
 <div>false</div>
 }
}
```

# Get developer tool for chrome

- Helpful for debugging allows you to see react elements in element inspector
- <https://chrome.google.com/webstore/detail/react-developer-tools/fmkadmjgofadopljbjfkapdkoienihi?hl=en>

A screenshot of the Chrome Web Store page for React Developer Tools. The page features the React logo on the left, the title "React Developer Tools" in the center, and a blue "Available on Chrome" button on the right. Below the title, it says "Offered by: Facebook". There are five stars and a rating of 1,080, along with the category "Developer Tools" and "1,298,611 users". At the bottom, there are navigation tabs for "Overview", "Reviews", "Support", and "Related". A browser window is visible at the bottom, showing a "TodoMVC" application with the URL "http://myreactwebsite.com/todoist".
